UniGuard AI Microservices Architecture

This directory contains the modernized microservices architecture for the UniGuard AI platform.

Architecture

The monolithic backend has been decoupled into the following independent services:

- **api-gateway (Port 8000)**: Serves as the single entry point. Proxies frontend requests to the underlying services based on route prefixes (`/auth/*`, `/documents/*`, `/ai/*`).
- **auth-service (Port 8001)**: Validates Admin PINs and handles JWT generation.
- **document-service (Port 8002)**: Ingests enterprise PDFs, extracts text, chunks it, and uploads the embeddings to Pinecone (or local ChromaDB).
- **chat-service (Port 8003)**: Executes the 5-Agent Pipeline to process queries, retrieve context, analyze compliance risk, and generate summaries.
- **audit-service (Port 8004)**: Manages SQLite database and records the conversational audit logs async.

Running the Architecture

The easiest way to start all microservices is using Docker Compose.

```
```bash
From the UniGuard-AI-Microservices directory:
docker-compose up --build
```

## Project Source Code

...

### ### Environment Variables

Your API keys (Groq, Pinecone, AWS) are securely stored in the ``.env`` file at the root of the ``UniGuard-AI-Microservices`` folder. Docker Compose automatically injects them into the respective containers.

### ### Local Python Execution (Without Docker)

If you prefer to run them manually:

1. Create a python virtual environment and install requirements for each service.
2. Ensure you add ``UniGuard-AI-Microservices`` to your ``PYTHONPATH`` so the ``shared`` module can be resolved.
3. Start each service on its designated port.

```
```bash
$env:PYTHONPATH="C:\path\to\UniGuard-AI-Microservices"
uvicorn api-gateway.main:app --port 8000
uvicorn auth-service.main:app --port 8001
uvicorn document-service.main:app --port 8002
uvicorn chat-service.main:app --port 8003
uvicorn audit-service.main:app --port 8004
```
```

### File: `./requirements.txt`

```
fastapi
uvicorn
pydantic
requests
python-dotenv
pymupdf
langchain-text-splitters
chromadb
pinecone
sqlalchemy
pyjwt
python-multipart
boto3
```

# UniGuard AI - System Architecture & API Documentation

This document provides a comprehensive overview of the UniGuard AI platform's microservice architecture, multi-agent data flows, and REST API endpoints.

#### ## 1. High-Level Architecture

The system is built on a containerized **Microservices Architecture**. The frontend strictly communicates with a unified API Gateway, which intelligently proxies requests to specialized backend services.

```
```mermaid
graph TD
    subgraph TB
        %% Styling

...

2. Multi-Agent RAG Pipeline (Chat Flow)

When a user submits a query, the Chat Service orchestrates a sequence of 5 specialized AI agents to prevent hallucinations and strictly enforce university policy.

```mermaid
sequenceDiagram
    participant U as User
    participant C as Chat Service
    participant G as Groq LLM
    participant P as Pinecone DB
    participant A as Audit Service

    Note over C,G: Agent 4: Persona Generator
    C->>G: Summarize policy as Admin/Student/Faculty
    G-->>C: "According to the handbook, strict disciplinary action..."

    C->>A: Save Audit Log (Risk, Query, Response)
    C-->>U: Final AI Response
    ...

---

## 3. API Endpoints

All external requests from the frontend are routed through the API Gateway (`http://localhost:8000`).

### ? Auth Service (`/auth`)
| Endpoint | Method | Security | Description |
```

Project Source Code

```
|-----|-----|-----|-----|
| `/auth/login` | `POST` | Public | Authenticates an Admin using a secure PIN. Returns a JWT Bearer token. |

### ? Document Service (`/documents`)
| Endpoint | Method | Security | Description |
|-----|-----|-----|-----|
| `/documents/upload` | `POST` | Admin JWT | Accepts a `.pdf` file. Extracts text, splits it into
1000-character chunks, generates embeddings, and saves them to Pinecone. |
| `/documents/list` | `GET` | Public | Queries Pinecone for unique document sources and returns a list of
active policy files. |
| `/documents/{filename}` | `DELETE` | Admin JWT | Erases all vectors matching the specific document filename
from the Pinecone index. |

### ? Chat Service (`/ai`)
| Endpoint | Method | Security | Description |
|-----|-----|-----|-----|
| `/ai/chat` | `POST` | Public | Triggers the Multi-Agent LLM pipeline. Accepts a JSON payload containing the
user's `prompt`, `role` (Student/Faculty/Admin), and `history`. |

### ? Audit Service (`/audit` - Internal)
*Note: This service is typically only accessed internally by the Chat Service.*
| Endpoint | Method | Security | Description |
|-----|-----|-----|-----|
| `/audit` | `POST` | Internal | Stores a completed chat interaction into the local SQLite database. |
| `/audit/logs` | `GET` | Admin JWT | Retrieves all stored system logs for administrative review. |
| `/audit/export` | `GET` | Admin JWT | Exports the entire database as a CSV for reporting. |

DocuMind - Enterprise Document RAG Platform

DocuMind is a top-tier **Retrieval-Augmented Generation (RAG)** application built to allow seamless, intelligent chatting with uploaded enterprise documents. Designed with a robust FastAPI backend and a stunning, glassmorphism-inspired React frontend, it demonstrates industry-level Machine Learning and Software Engineering practices.

? Key Features

- * **Stateless Chat Memory:** The React frontend maps and securely transmits conversational state context dynamically to the FastAPI backend, ensuring the LLM never loses track of the conversation without relying on heavy backend session storage.
- * **Verifiable Source Citations:** To eliminate LLM hallucinations, the ChromaDB vector search extracts exact document metadata alongside semantic chunks. The UI renders precise glowing **Source Badges** for every single answer retrieved from the knowledge base.
- * **Dynamic Document Management:** Exposed REST endpoints allow the frontend to seamlessly query underlying vector metadata. Users can view active enterprise documents and selectively delete PDFs directly from the vector store via the UI.
- * **Visual Excellence:** A highly-polished "Electric Cyan" dark theme featuring native CSS glassmorphism, pulse animations, responsive typography, and `react-markdown` support for beautiful AI responses (code blocks, bullet points, headers).

?? Tech Stack

- Frontend (React):**
 - * Vite + React (JavaScript)
 - * Vanilla CSS (CSS Custom Properties, Glassmorphism, CSS Animations)
 - * `lucide-react` (SVG Icons)
 - * `react-markdown` (Rich Text Parsing)

Project Source Code

```
**Backend (Python/FastAPI):**
*   FastAPI & Uvicorn (High-performance API routing)
*   PyMuPDF (`fitz`) (Fast PDF text extraction)
*   LangChain (Text Splitting / Chunking)
*   ChromaDB (Persistent Vector Database)
*   Sentence Transformers (`all-MiniLM-L6-v2`) (Lightning-fast local CPU embeddings)
*   Groq API (Ultra-low latency LLM generation)

---

## ?? How to Run Locally

DocuMind runs as two separate services: the FastAPI Python backend and the React Vite frontend.

### 1. Start the FastAPI Backend
Ensure you have cloned or downloaded the backend repository (e.g., `DocuMind Enterprise Document RAG Backend`).

```bash
1. Navigate to the backend directory
cd "DocuMind Enterprise Document RAG Backend"

2. Activate your virtual environment
On Windows:
venv\Scripts\activate
On Mac/Linux:
source venv/bin/activate

3. Create a .env file and add your Groq API Key
echo "GROQ_API_KEY=your_key_here" > .env

4. Start the Uvicorn Server
uvicorn app.main:app --reload
```

*The backend will boot up and run on `http://localhost:8000`.*

### 2. Start the React Frontend
Open a new terminal window for the frontend.

```bash
1. Navigate to the frontend directory
cd DocuMind-Frontend

2. Install dependencies
npm install

3. Start the Vite Dev Server
npm run dev
```

*The frontend will boot up and run on `http://localhost:5173`. Open this URL in your browser to begin chatting!*
```

```
## ?? Architecture & RAG Pipeline

1. **Ingestion (`/documents/upload`):**
   - A user uploads a PDF. The FastAPI backend reads the raw bytes, parses the text using PyMuPDF, and splits the string using Langchain's `RecursiveCharacterTextSplitter` (1000 chunk size, 200 overlap).
   - The chunks are embedded locally using `SentenceTransformers` and saved into **ChromaDB** along with metadata (filename and chunk index).
2. **Retrieval & Generation (`/ai/chat`):**
   - The React frontend sends the user's prompt alongside the entire chat history.
   - The backend converts the string prompt into a vector and queries ChromaDB (`search_similar_with_metadata`).
   - The Top 3 most semantically similar chunks (and their metadata) are extracted.
```

Project Source Code

- The chunks are injected into a highly restricted **System Prompt** telling the LLM to *only* use the provided context.
 - The prompt, context, and history are shipped to the **Groq API** for lightning-fast inference.
3. **Response:**
- The generated answer and the source citations are returned to the React App, mapping seamlessly to the floating Chat UI.

Built by Pothula Ajay ? Machine Learning Engineer & Software Developer.
